

NATURE

Reference Guide

The *Nature* reference guide provides additional detail on key words (pages 2-3), trait cards (pages 4-6), round structure (page 7), and iconography (page 8).

Key Words

The key words have specific in-game meanings that explain how a trait will interact with the core rules, and how it will interact with the other traits.

Feeding Action: There are two basic feeding actions; **foraging** and **hunting**.

Forage: When a species **forages**, it **eats** plant(s) from the watering hole equal to the number on its size dial.

Hunt When a species **hunts**, it **eats** meat from the supply equal to the size of the hunted species, and 1 population of the hunted species is **killed**.

Starve: When a species **starves**, choose a hungry population of that species to be **killed**.

Pass: Once a player **passes** as their feeding action, they are out of the Feeding Phase for the remainder of the round.

Other Actions

Eats: A species may **eat** only if it has hungry population. When a species eats, place each **eaten** food on one of its hungry population.

Killed: When a population is **killed**, flip it over so this side is showing and return any food on it to the supply. **Killed** population will be added as population to your new species in the next round. The player who controls the population that is **killed** chooses which population is **killed.**

Other Key Words

Card: A card is either in the draw deck, the discard pile, or your hand. Cards played on species are called traits. Discarding a card from your hand provides a benefit. Discarding a trait does not provide a benefit.

Extinction: A species goes extinct when its last population is **killed** or **starves.** See Extinction in the *Nature* rulebook for further clarification (on page 17).

Food: Plant and meat are food used to keep population from **starving**.

Fed Population: A fed population has food on it: or

Fully Fed: A species is fully fed when none of its population are hungry.

Hungry: A population is hungry when it doesn't have a food on it. A species is hungry when it has at least 1 hungry population.

Ignores: A species that ignores a defensive trait while **hunting** will act as if that trait does not exist. This key word is used in several of the modules.

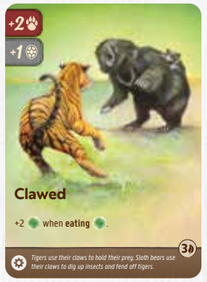

Size: Every species has a size dial to indicate its size. The size of a species determines how effective it is at **hunting**, **defending**, and **foraging**.

Species: A species consists of size dial, at least 1 population, and between 0 and 3 traits.

Trait: When a card is played on a species, it is called a trait. Each species may have up to 3 traits. Any trait that is removed from a species becomes a card again.

Each trait in the *Nature* deck has effects that are additive, so having two copies of the same trait will have double the effect, and having three copies will have triple the effect.

Clawed

A species with *Clawed* adds 2 to their hunt value when **hunting**, and 1 to their defense value when being **hunted**.

When **eating** plants , a species with *Clawed* will **eat** 2 additional plants from the same source.

Fast

A species with *Fast* cannot be **hunted** by a species with fewer copies of the *Fast* trait.

For example, a hunter with 1 copy of *Fast* can **hunt** a species with 1 copy of *Fast*, but cannot **hunt** a species with 2 or 3 copies of *Fast.*

Horned

When a species with *Horned* is **hunted**, it will **kill** population of the hunter. The number of population it **kills** will be equal to its size.

For example, when a size 1 species with *Horned* is **hunted**, it will **kill** 1 population of the hunter, and when a size 3 species with *Horned* is **hunted**, it will **kill** 3 population of the hunter.

When a species with *Horned* is **hunted**, 1 of its population will be **killed** as normal, even if the hunter goes extinct.

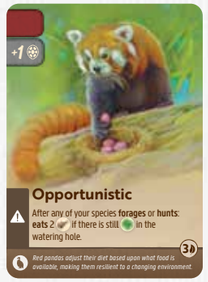

Hunter

When the *Hunter* trait is played, flip its size dial → to the HUNTER side. A species with *Hunter* can no longer take the **forage** feeding action. It takes the **hunt** feeding action instead.

A hunter can **hunt** a species if:

- its hunt value is equal to or greater than the defense value of the hunted species, and
- it has the traits necessary to overcome the hunted species' defensive traits.
- it has hungry population .

See Hunting in the *Nature* rulebook for further clarification (on page 16).

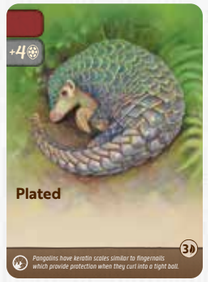

Opportunistic

A species with *Opportunistic* adds 1 to their defense value when being **hunted**.

Opportunistic triggers after any of your species **forages** or **hunts**, as long as there are plants in the watering hole after the feeding action is taken. When *Opportunistic* triggers, the species with *Opportunistic* **eats** 2 meat from the supply.

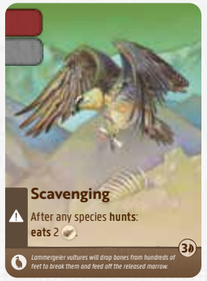

Each *Opportunistic* triggers independently. For example, if a species has 2 copies of *Opportunistic* and a *Social*, it would **eat** a total of 8 meat .

Plated

A species with *Plated* adds 4 to their defense value when being **hunted**.

Scavenging

Scavenging triggers after any species **hunts**. This may happen on your feeding turn or on someone else's feeding turn.

When *Scavenging* triggers, the species with *Scavenging* **eats** 2 meat from the supply.

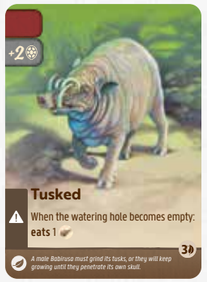

Each *Scavenging* triggers independently. For example, if a species has 2 copies of *Scavenging* and a *Social*, it would eat a total of 8 meat.

Social

A species with *Social* gets 2 additional food when it **eats**. The additional food comes from the same source as the original food; from the watering hole when it's plant(s) and from the supply when it's meat.

Social works when a species **forages** or **hunts**, but it can be combined with any trait that **eats** such as *Opportunistic*, *Scavenging*, and *Tusked*.

Tusked

A species with *Tusked* adds 2 to their defense value when being **hunted**.

Tusked triggers any time the last plant is removed from the watering hole. *Tusked* traits will trigger regardless of who the current player is and may trigger multiple times in a round if additional food is added to the watering hole.

When *Tusked* triggers, the species with *Tusked* **eats** 1 meat from the supply.

Each *Tusked* triggers independently. For example, if a species has 2 copies of *Tusked* and a *Social*, it would eat a total of 6 meat.

This chart shows the round structure in *Nature* combined with additional steps from Modules 1-6.

ROUND STRUCTURE		
Preparation	**1.** Roll the climate die	*Arctic, Climate, Desert*
	Add plants to the watering Hole	
	Add fed population to the faraway Place	*Flight*
	2. Get a new species	
	3. Draw cards	
Adapting Phase	**1.** Play cards	
	2. Reveal trait cards	
Feeding Phase	**1.** Move *Fat Tissue* food	*Arctic*
	2. Take feeding turns	
	3. Resolve climate (/)	*Arctic, Climate, Desert*
Scoring	**1.** Migrated species return	*Flight*
	2. Nesting triggers	*Flight*
	3. Put food behind player screens	
	4. Game End Bonus	*Arctic*
	5. Flip Disaster Card	*Natural Disasters*

APPROXIMATE ANIMAL SIZE

Size 1:
1-50 lbs
Rabbit / Fox

Size 2:
50-200 lbs
Gazelle / Wolf

Size 3:
200-700 lbs
Bear / Lion

Size 4:
700+ lbs
Elk / Crocodile

Icon	Description	Module
	size dial	
	flip the size dial	
	population	
	killed population	
	plant food	
	meat food	
	fruit food	*Amazon Rainforest*
	fed population	*Amazon Rainforest, Flight*
	defense value	
	hunt value	
	trigger ability	
	cold protection	*Tundra, Climate, Natural Disasters*
	heat protection	*Climate, Sahara Desert*
	poison resistance	*Amazon Rainforest*
	immediate effect	*Natural Disasters*
	comet token	*Natural Disasters*
